

SCALING UP: ATTENDEES MET NEXT-LEVEL AM WITH TRUE 4K AND SCROLLING TECH SOLUTIONS AT RAPID+TCT

Posted on May 12, 2023

Meeting/greeting all technology and market leaders in the AM world, the US exhibition team manifested Visitech's position as a critical supplier to the 3D printing industry – particularly for the machine builders and customers looking to transition from rapid prototyping to full-scale

production solutions.

New technology, a big announcement involving a Texas factory, and inspiring meetings wrapped up Visitech's three days at North America's most influential additive manufacturing event, Rapid+TCT.

Full-scale production capabilities

Game-changing productivity is critical for using additive manufacturing for full-scale production. Visitech exhibited solutions containing projection subsystems for AM machines. These subsystems allow multiple projectors to be ganged together to form high-productivity configurations for DLP stereolithography, plastic powder bed fusion, and bio-printing applications. They are readily available to meet machine builders' demand to reach higher and move the AM industry forward.

Next-level technology

Industry representatives and the trade press were excited to learn about Visitech's plans for a new, complete US factory to support the demand growth. Inspiring demonstrations of the latest true 4K projection system and the LRS-MCx-NIR scrolling technology fueled reactions that indicate that the planned Dallas factory – when completed – will be busy.

Supporting the customers

While highlighting the exciting new US factory announcement and multiple product demonstrations with inspired customers, the Visitech exhibition team takes home a humble appreciation from Rapid+TCT 2023 – and an elaborate to-do list for exhibition follow-up activities.

“We appreciate the deep trust customers have placed in us and were thrilled to announce our US factory plans to support our customer growth,” said Adam Kunzman, CEO of Visitech Americas.
